Abstract. In this paper, we study Wiener processes with $N(0,1)$ -random trend using wavelet transform. We study its some properties and wavelet expansion.

Keyword: Wiener processes; $N(0,1)$ -random trend; wavelet; expansion

1. Introduction

The stochastic system is very important in many aspects. Wiener processes is a sort of important stochastic processes. Wiener processes with $N(0,1)$ -trend is a class of useful stochastic processes in practice, its study is very valuable.

We will take wavelet and use them in a series expansion of signal or function. Wavelet has its energy concentrated in time to give a tool for the analysis of transient, nonstationary, or time-varying phenomena. It still has the oscillating wavelike characteristic but also has the ability to allow simultaneous time and frequency analysis with a flexible mathematical foundation. We take wavelet and use them in a series expansion of signals or functions much the same way a Fourier series the wave or sinusoid to represent a signal or function. In order to use the idea of multiresolution, we will start by defining the scaling function and then define the wavelet in terms of it.

With the rapid development of computerized scientific instruments comes a wide variety of interesting problems for data analysis and signal processing. In fields ranging from Extragalactic Astronomy to Molecular Spectroscopy to Medical Imaging to computer vision, one must recover a signal, curve, image, spectrum, or density from incomplete, indirect, and noisy data. Wavelets have contributed to this already intensely developed and rapidly advancing field.

Wavelet analysis consists of a versatile collection of tools for the analysis and manipulation of signals such as sound and images as well as more general digital data sets, such as speech, electrocardiograms, images. Wavelet analysis is a remarkable tool for analyzing function of one or several variables that appear in mathematics or in signal and image processing. With hindsight the wavelet transform can be viewed as diverse as mathematics, physics and electrical engineering. The basic idea is always to use a family of building blocks to represent the object at hand in an efficient and insightful way, the building blocks themselves come in different sizes, and are suitable for describing features with a resolution commensurate with their size.

There are two important aspects to wavelets, which we shall call “mathematical” and “algorithmical”. Numerical algorithms using wavelet bases are similar to other transform methods in that vectors and operators are expanded into a basis and the computations take place in the new system of coordinates. As with all transform methods such as approach hopes to achieve that the computation is faster in the new system of coordinates than in the original domain, wavelet based algorithms exhibit a number of new and important properties. Recently some persons have studied wavelet problems of stochastic process or stochastic system ([1]-[14]).

2. Basic definitions

Definition 1. Let $y(t) = W(t) + X(t)$ (1)

where $W(t)$ is Wiener processes, stochastic processes $X(t) \sqcup N(0,1)$, $X(t)$ and $W(t)$ are independent each other. we call $y(t)$ is $N(0,1)$ -trend Wiener processes.

We have

$$\begin{aligned} E[y(t)] &= E(w(t) + x(t)) = 0 \\ E(y(t_1)y(t_2)) &= E((w(t_1) + x(t_1))(w(t_2) + x(t_2))) \\ &= E(w(t_1)w(t_2)) + E(w(t_1)x(t_2)) + E(w(t_2)x(t_1)) + E(x(t_1)x(t_2)) \\ &= \sigma^2 \min(t_1, t_2) + t_1 t_2, t_1, t_2 > 0 \end{aligned} \quad (2)$$

We let $t_1 \geq t_2$ in following.

Definition 2 Let $\{x(t), t \in \mathbb{R}\}$ is a stochastic processes on probability space $(\Omega, \mathfrak{g}, P)$, we call

$$W(s, x) = \frac{1}{s} \int_{\mathbb{R}} x(t) \psi\left(\frac{x-t}{s}\right) dt \quad (3)$$

is wavelet transform of $x(t)$. where, ψ is mother wavelet ([11]).

Then, we have

$$w(s, x + \tau) = \frac{1}{s} \int_{\mathbb{R}} x(t) \psi\left(\frac{x + \tau - t}{s}\right) dt \quad (4)$$

Definition 3 Let mother wavelet $\psi(x)$ is function:

$$\psi(x) = \begin{cases} 1, 0 \leq x < \frac{1}{2} \\ -1, \frac{1}{2} \leq x < 1 \\ 0, \text{other} \end{cases} \quad (5)$$

we call $\psi(x)$ is the **Haar wavelet**.

Then, we have

$$\psi\left(\frac{x-t}{s}\right) = \begin{cases} 1, x - \frac{s}{2} \leq t < x \\ -1, x - s \leq t < x - \frac{s}{2} \end{cases} \quad (6)$$

$$\psi\left(\frac{x + \tau - t}{s}\right) = \begin{cases} 1, x + \tau - \frac{s}{2} \leq t < x + \tau \\ -1, x + \tau - s \leq t < x + \tau - \frac{s}{2} \end{cases} \quad (7)$$

3. Some results about density degree

We have

$$\begin{aligned} R(\tau) &= E[w(s, y)w(s, y + \tau)] \\ &= E\left[\frac{1}{s} \int_{\mathbb{R}} y(t) \psi\left(\frac{y-t}{s}\right) dt \right] \left[\frac{1}{s} \int_{\mathbb{R}} y(t_1) \psi\left(\frac{y + \tau - t_1}{s}\right) dt_1 \right] \\ &= \frac{1}{s^2} E\left[\iint_{\mathbb{R}^2} y(t) y(t_1) \psi\left(\frac{y-t}{s}\right) \psi\left(\frac{y + \tau - t_1}{s}\right) dt dt_1 \right] \\ &= \frac{1}{s^2} \iint E[y(t) y(t_1)] \psi\left(\frac{y-t}{s}\right) \psi\left(\frac{y + \tau - t_1}{s}\right) dt dt_1 \\ &= \frac{1}{s^2} \iint_{\mathbb{R}^2} [\sigma^2 \min(t, t_1) + t t_1] \psi\left(\frac{y-t}{s}\right) \psi\left(\frac{y + \tau - t_1}{s}\right) dt dt_1 \end{aligned}$$
